

SCRINODE

Product Design Specification

Mobile-first AI Bible research, study and ministry workspace

PRODUCT THESIS

Scripture is the primary interface. Study, Zedek AI, ministry work and the user’s library assemble around the active biblical text.

Product	Scrinode
Domain	scrinode.com
Stage	MVP / production-ready foundation
Specification	v0.1
Date	19 September 2026

DESIGN STATUS / FOUNDATION LOCKED, DETAIL ITERATION EXPECTED

01 / PRODUCT DEFINITION

Executive summary

Scrinode is an AI-powered Bible search, reference and theological research platform for preachers, teachers and Bible scholars. Its baseline experience is the complete Bible from Genesis to Revelation, designed for reading, navigation, search, selection, quotation, comparison and translation switching. Research capabilities are assembled around the verse or passage currently in view.

CORE PRINCIPLE

Scrinode is Bible-first, not AI-first. The text remains visible, addressable and authoritative in the interface; AI operates as an assistive research layer around it.

Product goals

- Make serious biblical research feel immediate and approachable on a phone without reducing scholarly depth.
- Let a user move naturally from Scripture → Study → Zedek AI → Work → Library while preserving the same active passage context.
- Ground AI answers in Scripture and identifiable research sources rather than relying on model memory alone.
- Support both rapid ministry preparation and deeper exegetical exploration.
- Deliver one coherent experience across mobile, tablet and desktop, with mobile as the primary design constraint.

Primary audiences

Audience	Core needs	Scrinode value
Preachers / pastors	Exegesis, sermon preparation, cross-references, historical context, original languages	Faster research-to-sermon workflow without losing textual grounding
Bible teachers / ministry leaders	Lesson planning, themes, explanations, saved notes, teaching structure	Structured study plus reusable teaching workspaces
Students / scholars	Text comparison, lexical data, context, citations, interpretive options	Traceable sources and contextual AI assistance
Serious Bible readers	Readable Scripture, search, questions, themes, notes	Low-friction path from reading to understanding

Success definition

The MVP succeeds when a new user can open Scrinode, locate any passage quickly, understand the surrounding context, inspect cross-references or original-language information, ask Zedek a grounded follow-up question, and save useful material into a workspace or library without needing to learn a complex toolset.

02 / EXPERIENCE PRINCIPLES

Design principles

Principle	Implication
Scripture first	Default screens foreground the biblical text. Research expands from a verse or passage rather than displacing it.
Context travels	The selected reference, range, translation and relevant research state persist across Study, Zedek, Work and Library actions.
Progressive disclosure	Mobile shows one primary task at a time; deeper tools appear through sheets, drawers, tabs and expandable sections.
Evidence before synthesis	Structured Scripture/research retrieval precedes AI explanation. Claims should expose sources where practical.
Deterministic study + generative AI	Study provides inspectable data and research views; Zedek synthesizes, compares and converses over that data.
Same IA, adaptive composition	Mobile uses bottom navigation and stacked views; large screens use top navigation and multi-pane layouts.
Ministry output is downstream	Research should be easily captured into sermons, liturgies, teaching notes and studies.
Respect interpretive plurality	Where views materially differ, Scrinode distinguishes textual observation, historical evidence and theological interpretation.

Trust model

Scrinode should visually distinguish four categories of information: biblical text, structured research data, sourced historical/scholarly material, and AI-generated synthesis. This distinction must survive copying, saving and exporting so users can tell what came from where.

ZEDEK'S ROLE

Zedek AI is a Scripture-grounded research assistant — not an oracle, spiritual authority or replacement for the user's theological judgment.

Non-goals for the MVP

- Competing immediately with every feature of mature desktop Bible suites.
- Replacing pastors, teachers, scholars, commentaries or local church discernment.
- Presenting AI-generated paraphrases as established Bible translations.
- Treating every theological disagreement as if a single interpretation is undisputed.
- Building separate mini-apps for every research function.

Global application shell

The global IA is intentionally constrained to five primary destinations. Account and application settings are excluded from the base menu and accessed from the profile control in the top-right.

Scripture	Study	Zedek	Work	Library
Read · search · select	Context · language · refs	Ask · explain · research	Sermons · liturgy · studies	Saved knowledge

Navigation semantics

Destination	Purpose	Representative content/actions
Scripture	The canonical reading and discovery surface	Bible reader, book/chapter navigation, reference search, translation switching, selection, copy/quote, compare
Study	Structured research around the active text	Context, cross-references, Greek/Hebrew, lexical data, themes, history, people, places, literary structure
Zedek	Conversational AI research layer	Quick AI actions, contextual chat, explanation, comparison, synthesis, research follow-ups
Work	Active ministry/research production	Sermons, liturgies, Bible studies, teaching notes, research projects
Library	Saved and reusable knowledge	Saved passages, highlights, notes, collections, research cards, conversations, references

Profile and settings

Profile remains in the top-right across breakpoints. It is deliberately separate from the five product domains.

- Profile and account details
- Security and authentication
- Notifications
- Appearance
- Bible preferences
- Zedek AI preferences
- Subscription / billing
- Help and support
- Sign out

04 / RESPONSIVE BEHAVIOR

Mobile-first, desktop-capable

Scrinode is designed from the smallest practical viewport outward. Desktop does not introduce a separate IA; it unlocks more simultaneous context and persistent panes.

Viewport mode	Primary navigation	Content composition	Research behavior
Mobile (<768 px)	Persistent bottom navigation	Single primary column; sheets/drawers for secondary actions	One task at a time; verse inspector and AI often use bottom sheets/full-screen transitions
Tablet (768–1199 px)	Top or adaptive navigation depending on width	Two-pane layouts where beneficial	Scripture + Study/Notes can coexist
Desktop (≥1200 px)	Primary navigation moves to top app bar	Two- or three-pane workspaces	Persistent Scripture, Study/Zedek and notes/workspace panes as appropriate

Desktop composition

DESKTOP RULE

Use extra width to increase research visibility, not to stretch mobile content into long lines.

A wide Scripture research layout can expose Bible/book navigation at left, the biblical text in the center, and a contextual Study/Zedek/Notes panel at right. Pane visibility should be user-controllable and responsive to available width.

Persistent global elements

- Scrinode brand / contextual title area
- Primary navigation
- Top-right profile/avatar
- Active Scripture context where relevant
- Global search entry point or keyboard shortcut on large screens
- Responsive content container with readable text measure

05 / CORE EXPERIENCE

Scripture

Scripture is the default and foundational destination. The Bible exists as a complete navigable corpus from Genesis to Revelation. Everything else is downstream from the current passage.

Core capabilities

- Browse by testament, book and chapter.
- Navigate directly by canonical reference.
- Search exact words, phrases, topics and natural-language descriptions.
- Switch among available Bible translations without losing position.
- Compare multiple translations.
- Select a word, phrase, verse, verse range or paragraph.
- Copy, quote, share, highlight, note and save selected text.
- Open structured Study views or invoke Zedek directly from the selected scope.

Bible reader anatomy

Region	Mobile behavior	Desktop behavior
Header	Book/chapter control, translation control, search access, profile	Top navigation plus book/chapter and translation controls
Reading surface	Single readable column, generous touch targets	Centered reading column; optional navigation and research panes
Verse interaction	Tap/select opens Verse Inspector bottom sheet	Selection opens contextual side panel or anchored inspector
Contextual actions	Copy, Quote, Compare, Save, Study, Ask Zedek	Same actions with more persistent affordances
Navigation	Chapter gestures/buttons and book picker	Book/chapter tree or compact navigator plus keyboard support

Selection scope

Selection	Contextual actions
Word	Define; original language; lemma; morphology; occurrences; ask Zedek
Phrase	Copy/quote; compare translations; phrase study; ask Zedek
Single verse	Context; cross-references; compare; history; themes; save; ask Zedek
Verse range / paragraph	Explain passage; structure; themes; cross-references; create study; add to Work; ask Zedek

Translation model

Published Bible versions and AI language transformation must remain distinct. A licensed or open Bible version is presented as a canonical translation option. An AI-generated language rendering is clearly labelled as AI-assisted and retains its source translation metadata.

06 / CONTEXTUAL RESEARCH

Verse Inspector and Study

The Verse Inspector is the bridge between reading and research. It keeps the user anchored to the selected text while exposing actions and structured data. Study is the full destination for deeper inspection of the same active context.

Verse Inspector — recommended sections

- Selected text + canonical reference
- Copy / Quote / Compare / Save
- Context
- Cross-references
- Original language / word study
- Themes
- History / ancient world
- People and places
- Notes
- Ask Zedek

Study modules

Module	Purpose	MVP expectation
Context	Understand the selected text within paragraph, section, chapter, book and canon	Immediate + broader literary context; context-aware retrieval
Cross-references	Discover connected passages	Curated/data-driven references with relation labels where available
Original language	Inspect Greek/Hebrew/Aramaic source data	Tokens, lemma, transliteration, morphology, gloss/sense, occurrence links
Themes	Trace recurring biblical concepts	Theme tags and related passages; deeper graph later
History	Surface relevant ancient setting	Sourced historical/cultural notes; clearly separated from textual claims
People & places	Explore biblical entities	Entity summaries and linked occurrences; maps can follow post-MVP

Literary structure	See rhetorical/narrative organization	Section/pericope structure and AI-assisted observations with evidence
--------------------	---------------------------------------	---

Context Engine

For a selected verse, Scrinode should reason across concentric scopes rather than treating the verse as an isolated sentence:

CONTEXT HIERARCHY

VERSE → PARAGRAPH / PERICOPE → CHAPTER → BOOK → AUTHOR / CORPUS → TESTAMENT → CANONICAL THEMES

The exact retrieved scope is query-dependent. Zedek should receive the relevant surrounding text and structured research context before generation.

07 / AI EXPERIENCE

Zedek AI

Zedek AI is Scrinode’s named Scripture-grounded research assistant. “Zedek” is used conversationally in the interface; “Zedek AI” is used in formal product language and settings.

Primary interaction modes

Mode	Example	Behavior
Quick action	Explain this verse	Runs a structured prompt/retrieval workflow against the active selection
Contextual chat	Why does John call Jesus “the Word”?	Opens conversation already grounded in the active passage and its research context
Open research	Compare resurrection accounts	Routes the question to multi-passage retrieval and structured comparison
Workspace assist	Turn these notes into a sermon outline	Uses explicit workspace content plus linked Scripture/research artifacts

Suggested quick actions

- Explain this verse / passage
- Explain the context
- Explore the Greek / Hebrew
- Find related passages
- Historical background
- Trace this theme

- Compare interpretations
- Summarise this section
- Create study questions
- Add insight to workspace

Zedek behavioral contract

- Start with the biblical text and the user's active context.
- Distinguish direct textual observation from interpretation and application.
- Cite relevant Scripture and identifiable research sources.
- Prefer structured lexical data over model-recalled claims about Greek/Hebrew.
- Surface meaningful interpretive disagreement rather than flattening it.
- Avoid fabricated quotations, sources, historical facts and lexical claims.
- Preserve provenance when research cards are saved into Work or Library.
- Support ministry preparation without presenting itself as spiritual authority.

Active Scripture Context object

STATE REQUIREMENT

Every contextual Zedek session should know the canonical reference, selected range, active translation, selected text, relevant surrounding passage and any explicitly loaded study data.

08 / USER OUTPUT

Work and Library

Work

Work is where research becomes ministry or scholarly output. On mobile it behaves as focused project editing; on desktop it can pair a workspace with Scripture and research panes.

Workspace type	MVP content model
Sermon	Title, text, theme/proposition, outline, exposition, illustration, application, conclusion, prayer, linked research cards
Liturgy / service flow	Service sections, readings, prayers, songs/notes, transitions, linked passages
Bible study / teaching	Passage, objectives, observations, questions, notes, applications, references
Research project	Freeform structured notes, linked passages, sources, Zedek threads and collections

Research capture

Any useful result — verse, cross-reference, lexical insight, historical note, Zedek response segment or user note — should be saveable as a reusable research card with source/provenance metadata. A card can be attached to one or more workspaces without duplicating the underlying evidence.

Library

Library is the long-term knowledge layer. It stores and organizes the user's saved material rather than becoming another editing environment.

- Saved passages and verse ranges
- Highlights
- Notes
- Research cards
- Collections/folders/tags
- Saved Study views or snapshots
- Zedek conversations worth retaining
- References and sources
- Recently opened items

Work vs Library rule

MENTAL MODEL

Work = what I am producing. Library = what I am keeping and reusing.

09 / DISCOVERY

Universal search and intent routing

Users should not need separate search modes for references, keywords, topics, lexical terms and theological questions. One input can infer intent and route the query to the appropriate retrieval path.

Input	Detected intent	Primary result
John 3:16	Reference navigation	Open passage
faith without works	Phrase / keyword search	Scripture results with matching context
verses about resurrection	Semantic Scripture search	Relevant passages first
agape	Lexical query	Original-language entry + occurrences
why did Jesus wash their feet?	Biblical research question	Relevant passage retrieval, then Zedek synthesis
compare Romans and Galatians on justification	Comparative research	Multi-passages research view + optional Zedek analysis

SEARCH PRINCIPLE

Retrieve Scripture first. Interpret second.

Search results should privilege canonical passages and structured research results. AI synthesis can be offered alongside or after retrieval, but should not replace the underlying evidence.

10 / PRODUCT DATA MODEL

Foundational objects and state

The canonical verse is an addressable entity independent of any specific translation. Translation text, original-language tokens, cross-references, themes and user artifacts attach to stable canonical identifiers.

Canonical identifiers

EXAMPLE

JHN.1.1 • ROM.8.28 • GEN.1.1

An OSIS-style identifier scheme is appropriate because it is human-debuggable, stable and broadly compatible with Scripture tooling. The final implementation should define how deuterocanonical/apocryphal books and versification differences are represented before ingestion expands.

Core entities

Entity	Key responsibility
CanonicalReference	Book/chapter/verse/range identity independent of translation
BibleTranslation	Version metadata, license, language, versification, text source
VerseText	Translation-specific text linked to canonical reference
OriginalToken	Language, surface form, lemma, morphology, transliteration, lexical links
CrossReference	Source reference, target reference, relation/source metadata
StudyArtifact	Theme, historical note, entity, literary observation, provenance
ActiveScriptureContext	Runtime state shared across navigation destinations
UserArtifact	Highlight, note, saved passage, research card, collection
Workspace	Sermon, liturgy, study or project document and its linked

	artifacts
ZedekThread	Conversation with explicit Scripture/workspace grounding

Active context

At minimum, shared app state should preserve: canonical reference/range, translation, selected text, optional selected tokens, previous reading position and any Study data explicitly opened for the current interaction.

11 / AI + RETRIEVAL ARCHITECTURE

Grounded AI system design

The product should avoid a direct “user → model → answer” architecture for biblical research. Zedek is the final reasoning/synthesis layer over retrieved Scripture and approved research data.

Provider abstraction

The AI layer should be model-provider independent. The application can expose internal interfaces for generation/streaming, embeddings, structured output and moderation/validation rather than binding core product behavior to one vendor.

Retrieval priorities

1. Canonical Scripture text for the active translation and necessary surrounding scope.
2. Structured cross-reference/original-language/theme/entity data.
3. Approved historical and scholarly sources with provenance.
4. User-authorized workspace/library context.
5. Only then: model reasoning and composition.

12 / UI SYSTEM

Visual and interaction system

Visual character

Scrinode should feel calm, scholarly and contemporary rather than ornamental or ecclesiastically themed. Scripture readability is more important than decorative branding. Use generous whitespace, strong typographic hierarchy and restrained accent color.

Core component families

Family	Components
Navigation	Mobile bottom bar, desktop top nav, profile/avatar menu, breadcrumb/context title
Scripture	Verse row, passage block, book/chapter picker, translation selector, compare view, selection toolbar
Research	Verse Inspector, Study tabs/sections, lexical token card, cross-reference card, context card, source chip
Zedek	Ask composer, quick-action chips, answer block, citation/source treatment, conversation history
Work	Workspace editor, outline blocks, linked research cards, Scripture embed, note block
Library	Saved-item card, collection, filters, search, recent activity
System	Bottom sheet, side panel, modal, toast, skeleton/loading, empty/error states

Interaction rules

- Primary Scripture text must remain selectable and accessible to native copy/share behavior where possible.
- Tap targets should be comfortable for one-handed mobile use; do not rely on hover for essential actions.
- Secondary research appears without losing reading position.
- Back navigation should restore prior scroll/selection state.
- Loading states should preserve layout and stream content where appropriate.
- Destructive account/workspace actions require clear confirmation; ordinary research actions should be low-friction.

Accessibility

- WCAG 2.2 AA target for product UI
- Semantic headings and landmarks
- Keyboard-navigable desktop experience
- Visible focus states
- Screen-reader labels for verse/action controls
- User-adjustable reading size and sufficient contrast

- Do not encode research categories using color alone

13 / CRITICAL JOURNEYS

Core user flows

Flow A — Read → Study → Ask

1. Open Scripture and navigate to a passage.
2. Select a verse or range.
3. Open Verse Inspector and choose Context, Cross-references, Original Language or another Study action.
4. Tap “Ask Zedek” or a quick AI CTA.
5. Receive a grounded answer that retains the active Scripture context.
6. Save the useful result to Library or attach it to a workspace.

Flow B — Search → Passage

1. Enter reference, phrase, topic or question in universal search.
2. Intent router returns Scripture-first results.
3. Open a result without losing the query context.
4. Continue reading, Study, or ask Zedek about the passage.

Flow C — Research → Sermon

1. Create/open a sermon workspace.
2. Attach a primary Scripture text.
3. Move between Scripture/Study/Zedek while the workspace remains linked.
4. Save selected verses, lexical insights, context notes and sourced AI insights as research cards.
5. Arrange cards/notes into sermon structure and edit the final manuscript/outline.

Flow D — Continue across devices

1. Read or research on mobile.
2. Saved state syncs reading position, highlights, notes and workspace changes.
3. Open desktop and recover the same active project/context.
4. Use wider multi-pane layout for deeper preparation.

14 / DELIVERY SCOPE

MVP scope and prioritization

Priority	Capability	MVP definition
P0	Complete Bible reader	Genesis–Revelation baseline corpus, navigation, reference routing, translation selection, verse range

		support
P0	Search	Reference, keyword/phrase and foundational semantic Scripture search
P0	Selection + Verse Inspector	Word/verse/range interaction; copy/quote/save; entry points to Study and Zedek
P0	Study essentials	Context, cross-references, Greek/Hebrew core data, basic themes/history where source quality is ready
P0	Zedek AI	Context-aware quick actions + conversational chat with citations/provenance
P0	Accounts + sync	Authentication, profile, security baseline, cloud persistence
P0	Work	Sermon + general study/research workspace; linked Scripture/research cards
P0	Library	Saved passages, notes, highlights, research cards, conversations/collections
P1	Translation compare	Side-by-side/stacked comparison of selected translations
P1	Liturgy workspace	Structured service flow and readings
P1	Advanced entity/theme exploration	Richer people/place/theme graph navigation
P2	Maps, timelines, collaboration	Post-MVP depth and team features

Production readiness baseline

- Observability for search, AI retrieval/generation and errors
- Rate limiting and abuse controls
- Data backup and migration discipline
- Source/license registry for every Scripture/research dataset
- Privacy controls and account deletion/export strategy
- Responsive performance budgets
- Feature flags for experimental Study/Zedek capabilities
- Graceful fallback when AI or external content services are unavailable

Non-functional requirements and product metrics

Performance targets — design intent

- Bible chapter navigation should feel near-instant after initial app load or cache warm-up.
- Reader interactions (selection, inspector open/close, translation switch UI) must remain responsive under normal mobile conditions.
- Zedek responses should stream rather than block until full completion.
- Desktop multi-pane layouts must not degrade Scripture readability or cause uncontrolled horizontal scrolling.

Trust / quality metrics

Metric	Why it matters
Citation coverage for factual research claims	Measures whether AI synthesis remains inspectable
Source-open rate	Indicates whether users find provenance useful
Answer correction / negative feedback rate	Tracks quality regressions in Zedek
Search-to-passage success	Measures whether users can reach intended Scripture quickly
Study-to-save / Study-to-Work conversion	Measures whether research is becoming useful output
Workspace return rate	Signals whether Scrinode is becoming part of sustained ministry preparation

Privacy and security

- Treat user notes, ministry drafts and AI conversations as private user content by default.
- Apply least-privilege access across application services.
- Separate public Bible/source data from private user/workspace data.
- Encrypt transport; use secure credential/session practices; log access-sensitive operations appropriately.
- Do not expose private workspace context to Zedek unless the current request/session is authorized to use it.

16 / DEFINITION OF DONE

MVP acceptance criteria

- A user can browse from Genesis through Revelation and navigate directly to a canonical reference.
- A user can change Bible translation without losing their current passage.
- A user can select a verse/range and open context-aware actions.
- Study can show at minimum context, cross-references and original-language data for supported passages.
- Zedek can be invoked from the active passage and retains that context through follow-up questions.
- A user can save research into Library and attach useful material to a workspace.

- The five-item IA is consistent across devices: bottom navigation on mobile and top navigation on large screens.
- Profile/settings remains top-right and does not consume a primary navigation destination.
- Desktop exposes materially better multi-pane research/productivity behavior rather than merely scaling up mobile.
- AI output clearly differs visually and semantically from Bible text and cited research data.

Decisions currently locked

Decision	Status
Bible-first product model	Locked
Primary IA: Scripture / Study / Zedek / Work / Library	Locked
AI assistant name: Zedek AI	Locked
Profile/settings in top-right	Locked
Mobile-first with top navigation on large screens	Locked
Shared active Scripture context across product domains	Locked
Study and AI remain conceptually distinct	Locked

Next design decisions

- Scripture screen wireframe and interaction detail.
- Verse Inspector hierarchy and mobile sheet behavior.
- Study landing screen and module navigation.
- Zedek conversation UI, source/citation treatment and quick-action taxonomy.
- Workspace editor model and sermon/liturgy block system.
- Bible/research dataset licensing matrix and normalized ingestion schema.
- Design token system: type scale, spacing, radius, color, icons, elevation and motion.
- Authentication/onboarding flow and default Bible translation selection.

RECOMMENDED NEXT ARTIFACT

Create the Scripture + Verse Inspector UX specification first. It is the nucleus that every Study, Zedek, Work and Library workflow depends upon.

APPENDIX A

Working terminology

Term	Definition
Active Scripture Context	The canonical passage/range, translation, selection and

	relevant study state shared across the app.
Verse Inspector	Contextual interaction surface opened from selected Scripture.
Study	Structured, inspectable research tools and datasets associated with Scripture.
Zedek AI	Scrinode's Scripture-grounded conversational research assistant.
Research card	Reusable saved artifact containing an insight, source or Scripture reference with provenance.
Work	User-authored ministry/research projects: sermons, liturgies, studies and related documents.
Library	Persistent store of saved Scripture, notes, highlights, research cards, collections and conversations.
Canonical reference	Stable Bible location independent of a specific translation.
